Pitch Deck

2026 PITCH

Fade.

Your accounts, anywhere.
Without leaving a trace.

A pitch by Dima Alhajajlah

Public PCs are stuck in 2005.

Every shared computer — libraries, hotels, classrooms, internet cafes — still asks people to type passwords, click "stay logged in", and remember to sign out. Most don't. Tokens, sessions and personal data get left behind on machines they'll never touch again.

Type-and-pray logins

Passwords typed on a keyboard you can't trust.

Sessions left behind

Cookies and cached inboxes the next user inherits.

Tokens nobody owns

OAuth grants tied to a machine, not a person.

THE IDEA, IN ONE SENTENCE

Your phone holds your accounts. A QR code makes them appear on a public screen. When you're done, they vanish.

One-time setup on the phone • Disposable on the screen

Five steps. From phone to screen and back.

1

Connect once on your phone.

Gmail, Outlook, Calendar — linked to you, not a device.

2

Walk up to any PC.

Open fade.app and scan the QR shown on screen.

3

Your accounts appear.

Inbox, calendar, drive — projected on that screen, just for the session.

4

Hit "End" when you're done.

Cookies, tokens and cache wiped from the PC instantly.

5

Your phone keeps everything.

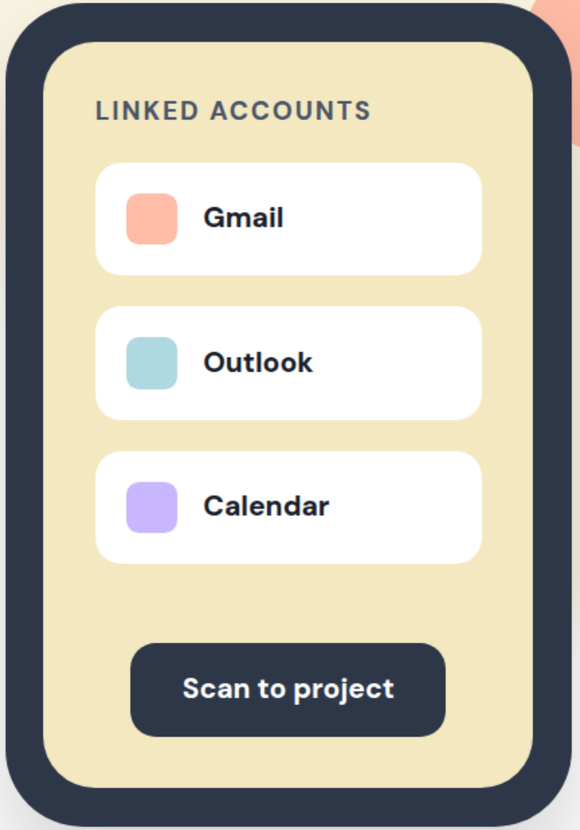

Next screen, same scan. No re-login, ever.

Identity

Your phone is the key.

Authentication happens once, on the device you already trust. The PC never sees a password, never owns the tokens, never remembers you.

- Lose the PC — nothing leaks.
- Switch PCs — pick up where you left off.
- The phone is the identity. The screen is borrowed glass.

Built to grow beyond email.

Email and calendar today. Anything OAuth tomorrow. The same beam. The same vanish.

TODAY

Email & calendar

Gmail

Outlook

Google Calendar

SOON

Files & teamwork

Drive

Dropbox

Notion · Slack

EVENTUALLY

Anything logged-in

Banking dashboards

Health portals

Any OAuth surface

Why it matters.

Anyone who's borrowed someone else's screen — and worried about what they left behind.

Travelers

Hotel business centers, airport lounges, cybercafes abroad.

Students

University labs, library terminals, shared classroom PCs.

Shift workers

Hot-desks, factory kiosks, retail back-office machines.

Anyone, occasionally

Anyone who's ever forgotten to log out of a borrowed screen.

WHERE THIS GOES

The phone becomes the wallet for digital identity.

Fade is a thin layer between people and the screens around them. Every public surface becomes safe to use, briefly, on your terms. The first version is email. The endgame is every login on every borrowed screen.

Fade — leave nothing behind.
